

Spiral Matrix

→ One approach
top = 0, right = mat[0].length - 1;
left = 0, bottom = mat.length - 1;
while (top <= bottom & left <= right) {

1) Right :-
for (i = left; i <= right; i++)
ans.add(mat[top][i]);
top++;

2) bottom :-
for (i = right; i >= left; i--)
ans.add(mat[bottom][i]);
bottom--;

3) left + view
if (top <= bottom) {
for (i = right; i >= left; i--)
ans.add(mat[bottom][i]);
bottom--;

4) Top view
if (left <= right) {
for (i = bottom; i >= top; i--)
ans.add(mat[i][left]);
left++;

Dry Run :- Right + bottom + left + top

~~Ex 2)~~

l = 0, R = 3
top = 1, b = 0
→ If this condition is not present here we end up with wrong solution
→ with the help of (top <= bottom) we check any other row is present or not.

top = 1, R = 1
top = 1, b = 2
→ with help of this condition we check there are any other column is present or not.
